

COURSE UNIT (MODULE) DESCRIPTION

Course unit (module) title	Code
Multivariate Statistics	

Lecturer(s)	Department(s) where the course unit (module) is delivered
Coordinator: prof. Vydas Čekanavičius	Department of Statistical Analysis, Institute of Applied
	Mathematics, Faculty of Mathematics and Informatics
Other(s):	

Study cycle	Type of the course unit (module)
Second	Compulsory

Mode of delivery	Period when the course unit (module) is delivered	Language(s) of instruction
Face-to-face	First Semester	English/Lithuanian

Requirements for students					
Prerequisites:			Additional requirements (if any):		
	First course in Statistics				

Course (module) volume in credits	Total student's workload	Contact hours	Self-study hours
5	150	42	108

Purpose of the course unit (module): programme competences to be developed							
To teach students professionally analyze economic, social, biologic etc. data applying classical and modern methods of							
statistical analysis. Enhance critical and analytic thinking.							
Learning outcomes of the course unit (module)	Teaching and learning methods	Assessment methods					
 To know various multivariate statistical research methods , principles of their application, interpretation and application strategies; To know relations among normal-based tests (ANOVA, MANOVA, ANCOVA); To comprehend interdependence of regression models (linear regression, logistic regression, HLM); To be able explain relations between latent factor and observed variables; To be able interpret latent factors in structural equation models; Correctly use in research context the main concepts of statistical modeling (SEM, HLM, GLM etc.), 	Lectures, case analysis	Control tests, individual problem solving, written examination					
 To be able explain and interpret obtained results and draw relevant conclusions,; To be able understand proofs of main propositions; To understand the main principles of adequacy of economic and statistical model to observed data;i 	Problem solving during seminars, group discussion	Control tests, written examination					

 To be able apply statistical packet for statistical data analysis correctly; To be able relate theoretical model to given data; To be able to choose correct estimation method in practice. 	Problem solving during seminars, group discussion; correct usage of statistical program	Control tests

Tests and exams	h
Consultation	2
Control tests	8
Exam	1

Assessment strategy	Weigh t,%	Deadline	Assessment criteria
Control tests (90%) and exam on theory (10%)			
Topics for the first control test	25%	During semester	Open book test. Theoretical problems related to multivariate normal distribution, problems related to spectral decomposition of matrices, simultaneous confidence intervals. Modeling of ANOVA, MANOVA and ANCOVA with statistical program
Topics for the second control test	25%	During semester	Open book test Canonical link function for given density from exponential family. Practical data analysis modeling logit, Poisson, negative binomial and Probit regressions.
Topics for the third control test	15%	During semester	Open book test. Matrix form of given HLM. Modeling of HLM with chosen statistical program.
Topics for the fourth control test	25%	During semester	Open book test, EFA and SEM models for given data.
Final exam	10%	January	Closed book consisting of theoretical propositions given during semester.
