

COURSE OF DOCTORAL STUDIES

Course title	Field of science (branch) code	University / Faculty	Institute / Department
Synoptic Climatology	Natural Sciences, (Physical Geography) N006	Vilnius University / Faculty of Chemistry and Geosciences	Institute of Geosciences / Department of Hydrology and Climatology
Study methods	Number of credits allocated	Study methods	Number of credits allocated
Lectures		Consultations	1
Individual work	8	Seminars	1
Course annotation			
Objective: the primary objective of this course is an explanatory analysis of low frequency variability of atmospheric processes at various spatial scales: global, hemisphere and regional. The course is intended to help students understand climate aspects in terms of atmospheric circulation patterns and modes.			
Content. Object and definition of synoptic climatology. Methods applied in synoptic climatology: synoptic, statistical and hydrodynamic. The concept of general circulation of atmospheric (GCA) as one of the main climatic factor and as a climate property. Factors influencing GCA on various scales: Insolation, absorption and other properties of solar radiation; Earth rotation; thermal and dynamic interaction of the atmosphere with the surface; geophysical and astronomic factors. Air masses: their properties and classification. Climatic fronts. Mean zonal circulation and troposphere – stratosphere interaction. Jet streams. Blocking processes. Surface pressure field, circulation in mid-latitudes, extratropic cyclones and anticyclones. Inter-tropical atmospheric disturbances. Hadley cell, Intertropical convergence zone (ITCZ), Monsoons, Tropical cyclones. Baroclinic instability and the development of extratropical disturbances. Waves in atmosphere, Rossby waves.			
Teleconnections in atmosphere and oceans (ENSO, AO). Teleconnections in extratropics (NAO, EA, PNA etc) and in tropics (MJO, IOD etc) and their interaction. General principles of classification of the large scale atmospheric processes. The usefulness of (atmospheric) circulation indices. Global circulation modeling: model types, their application in climate research.
